UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

IBBF/WBBA Boerboel Breed Standard

General Appearance:

The Boerboel is a wide mouthed Mastiff type dog originating from South Africa. The dog should be strong and muscular in appearance

Size:

Must be large but weight is not an indicator of potential functionality.

Adult, well balanced and completely grown males should ideally be 66cm in height measured at the top of the withers. Adult males smaller than 60 cm will be penalised males larger than 78cm will be penalised.

Adult, well balanced and completely grown females should ideally be 60cm in height measured at the top of the withers. Adult females smaller than 55 cm will be penalised and larger than 70cm will be penalised.

Size must be in relation to weight (see description under General Condition).

General Proportion:

The main structural components of the dog should show acceptable proportions to each other. Dog must not be “square” and should have a greater total length than total height and the relation between length and height should ideally be 10:9

Conformation:

Sturdy, compact conformation to achieve the highest degree of mobility.

Head:

The head is one of the most important aspects of the Boerboel breed and represents the character of the dog. The head should be short, broad, block shaped, muscular and a slight frown must be visible on the dog’s forehead when its interest is aroused

Proportion:

The length of the roof of the skull, measured from the middle of the eye to the end of the occiput) must be relative to the length of the nose bone in a relation of 1:1.5 as the ideal relationship. The head must widen slightly from the nose to the eyes.

Dome of skull:

The dome of the skull must be broad and flat on top. The general rule is to attract the dogs attention to get it to lift its ears to the “attention” position and then to gauge the “flatness” of the dome of the skull.

Profile:

World Boerboel Breeders Association PTY. LTD.

info@worldboerboel.com

www.worldboerboel.com

UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

Both the head and the muzzle must be cube shaped. In profile, the dome of the skull should be on the same parallel plane as the nose bone.

Eyes:

Expression: Intelligent, attentive and “guarded”.

- **Iris colour:**
Yellow to brown coloured iris allowed.
Blue colour iris is a disqualification.
- **Positioning:**
The eyes should be horizontal and any slant will be penalised.
The eyes must be widely spaced and look straight ahead.
- **Eyelids:**
Eyelids must be firm and well pigmented.
- **Spectacle area:**
The hair in the spectacle area should show adequate pigmentation.
- **General:**
The area between the eyes must be well filled and show a gentle depression. Eyes must not protrude (bulge).
Eyes must not be deep-set.
Third eyelid (nictitating membrane) must not be visible.

Stop:

Defined as the drop or break in the plane from the frontal bones of the skull to the nasal bones of the muzzle.

The stop must have a gradual slope and be well filled between the eyes. It should not be a sudden vertical plane such as in a Boxer nor non-existent as seen in Bull terriers.

Ears:

- **Shape and size:**
The ears must be medium sized (the tip must just reach the corner of the dog's mouth), V-shaped and of medium thickness.
- **Positioning:**
Must be high set but must still be on the sides of the head. Must fall away sideways and to the front, but remain against the cheek.
- **General:**
Deformity of one or both ears, as a result of a viral infection or earlier injury, is acceptable. Excessive rose ears are a disqualification. Any cosmetic procedure not allowed under local law such as cropped ears are a disqualification

Nasal bone:

World Boerboel Breeders Association PTY. LTD.

info@worldboerboel.com

www.worldboerboel.com

UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

The nasal bone should ideally be between 8 and 10 cm long. The roof of the skull must be in relation to the nasal bone (1:1.5).

The nasal bone must be straight and narrow slightly from the eyes to the mouth. The nasal bone must be on the same plane as the roof of the skull. A black mask on the nasal bone is optional

Nose:

The nose has wide nostrils that are widely spaced.

Lips:

The upper and lower lips must be loose and fleshy and show adequate pigmentation. Under the nose, the end of the upper lip must touch the top of the bottom lip but must not substantively overlap the bottom lip. The jowls should not be excessive but be moderately tight.

Cheeks:

The cheeks must be well filled and should create the fusion between the muzzle and the skull.

Jaws:

The jaws must reflect the characteristics of the Boerboel breed, strong and show good muscular development. The jaws must not be lacking in depth and must not be “pointed”.

Teeth:

The teeth must be white, well-formed and correctly spaced. The dog should ideally have a complete set of 42 teeth and missing teeth can lead to penalisation. Ideally, the dog should have a “scissor” bite (Outside of bottom teeth fits flush against the inside of the upper teeth).

An under bite, where the lower jaw protrudes further than the upper jaw, of less than 1cm is acceptable. Should it exceed 1 cm, the dog will be disqualified. Any visible sign of an overbite, where the upper jaw protrudes further than the lower jaw, will lead to disqualification.

Neck:

The neck must gradually increase in width from the head to the shoulders and be muscular to the extent that it shows a visible crest. The dewlap and scruff should be loose but the skin across the chest, especially between the front legs, should be tight. The neck must be in proportion to the rest of the dog and an excessively long or short neck must be seen as a serious flaw which could lead to disqualification.

Torso:

World Boerboel Breeders Association PTY. LTD.

info@worldboerboel.com

www.worldboerboel.com

UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

- **Ribcage:**

The ribcage is defined as the area from the first chest vertebrae to the last rib bone. The ribcage must ideally have a length proportion of 2:1 to the loin.

Front legs:

The front legs should be thick (substantive girth), strong and muscular.

Seen from any angle, the front legs must be as straight as possible and vertical to the plane of the ground. The elbows, wrists and paws must not turn inwards or outwards.

The pasterns must be short, sturdy and form a slight angle to both the pastern joint and the front leg. The distance between the knee joint and hock joint must not be too long to allow a well-balanced dog, supple, fluid movement.

The upper arm must show good, visible muscular development.

- **Front feet:**

The front feet should be large, well cushioned and rounded in shape.

The dog must have strong, short nails of any colour but light coloured nails could be interpreted as a sign of inadequate pigmentation. The front feet must be aligned close to straight to the front but it is recognised that most large dogs breeds show a slight turn-out of their front feet.

Shoulders:

The shoulders must not be too erect and show good, visible muscle definition.

“Loose” shoulder blades are a fault and will be penalised. The lay to, or distance between the withers, determines the motion and flexion of the neck and head and can seriously influence balance and movement and should therefore ideally not be less than 70mm but should be in proportion to the rest of the dog.

Chest:

The chest must be strong and broad. Viewed in profile, the chest should have a depth that extends below the elbow joints of the dog.

The ribs should be well formed and well rounded

Back (total span):

The back is defined as starting from a point between the scapula to the top of the tail attachment. The top line of the back must not be a “table top” but must show a slight indentation behind the shoulders. A too prominent or deep indentation is a sign of inadequate rib and back development. The back of all dogs should show prominent back muscles whilst adult males should show a “saddle” behind the shoulder blades consisting of muscle. The back must not be “round”. A rounded back is a sign of inadequate rib and back development. Viewed from the front or

World Boerboel Breeders Association PTY. LTD.

info@worldboerboel.com

www.worldboerboel.com

UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

the rear, the back should be straight, broad and in proportion to the rest of the dog.

Loin:

The loin is defined as the area from the rib cage to the pelvis. The loin must be short and ideally have a length proportion of 1:2 to the ribcage.

Croup:

The croup of the dog, defined as the last section of the back above the rear legs must be firm, strong and show visible muscular development. The croup must not droop excessively in adult dogs but it is accepted that the croups of younger dogs have a tendency to slope and will not be penalised. The ideal slope of the croup should be 23 degrees.

Upper hind leg:

The upper hind leg must be well developed with prominent, visible musculature

Lower hind leg:

The lower hind leg must be well developed with prominent, visible musculature both on the inside and the outside of the leg.

Knees:

The knees should be strong, firm and show correct angulation.

Hocks: Hock joints to be strong, firm, relatively short, strong, thick and parallel to each other

Hock joints should be bent at an angle of 45 degrees.

Hind paws:

The hind paws must be slightly smaller than the front paws, well cushioned, rounded and point straight forward.

The nails must be short and strong with a slight curve. The nails may be of any colour but light coloured nails could be interpreted as a sign of inadequate pigmentation.

Tail:

The tail must be positioned high and must be straight. Tails may be left long or docked at the third joint (where allowed). Kinked, corkscrew or deformed tails are disqualifying factors. Long tails should be sabre shaped and of adequate girth and length.

Sexual organs:

World Boerboel Breeders Association PTY. LTD.

info@worldboerboel.com

www.worldboerboel.com

UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

Sexual organs must be well developed. Males must have two well developed testicles.

The vulva must be firm in female dogs.

Scars or related injuries limiting sexual performance will be penalised.

The skin and hair around sexual organs should show adequate pigmentation

Anus:

The anus should show adequate pigmentation.

Coat:

The coat of the dog should be dense, smooth and short. Long hair is a disqualification. Curly hair is a disqualification.

Long and uncharacteristic whiskers such as those characterising other dog breeds are a disqualification.

Colour:

All colour variations are acceptable.

Pigmentation:

A black mask on the nasal bone is optional. All dogs should ideally show dark pigmentation on their skin.

Weak or inadequate pigmentation will be heavily penalised and could lead to disqualification.

In Piebald dogs there must be some pigmentation around the eyes, this may be slight but must completely surround the eye itself.

Appearance:

Old scars resulting from declared, acceptable surgical procedures, accidents or work factors are irrelevant and will not be penalised as long as performance is not limited.

General Condition:

The presented animal must be in a good general condition and should not be obese to the extent that muscular development and actual girth of the bone structure cannot be determined. In the case of the presentation of an underweight or obese dog, the dog will not be accepted for appraisal until such time as the problem is rectified. The weight of the presented dog must be in relation to size of the dog. Any dog with a physical handicap, excluding deafness, which was not the result of an earlier injury, will be disqualified.

Mobility:

The mobility of a dog is the ultimate test for correct conformation.

The hind legs of the dog should provide the main source of propulsion.

World Boerboel Breeders Association PTY. LTD.

info@worldboerboel.com

www.worldboerboel.com

UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

The dog should show suppleness, nimbleness and agility.

The dog should show the longest possible strides achievable considering its body length and have an effective ground-covering pace.

The dog, and the handler, should be able to maintain an adequate pace for the appraiser to properly evaluate the dog.

Temperament:

Boerboels are known for their fearless character and high intelligence. The dog must show loyalty to its master and obedience to commands (even if given by a handler). Boerboels are known for their threat perception and guarding instincts. Boerboels must accept children and not pose a threat to them or other persons that do not pose a threat to the dog, its owner or his property.

Boerboels must have an intelligent and trainable nature.

Temperament testing and Breed Suitability Testing, as approved by the IBBA Board, will be applied at any appraisal or special event for temperament evaluation and dogs can be either referred for obedience training or disqualified as a result of aggression or disobedience.

Penalisation (Faults):

- **Behaviour:**
 - Disobedience
- **Build and conformation:**
 - Lanky built.
 - Too short legs.
 - Square build where height and length is equal.
 - Not carrying the physical characteristics of their sex
- **Head:**
 - Mild entropion, ectropion or distichiasis
 - Bulging eyes
 - Deep set eyes
 - Third eyelid visible
 - Upper lip too long
 - Jaws lacking in depth
 - Pointy jaws
 - Excessively low set ears
 - Excessively highly set ears
- **Teeth:**
 - An under bite of less than 1 cm
 - Inability to keep tongue in mouth
- **Body:**
 - “Loose” shoulder blades
 - Too narrow chest
 - Back showing a prominent indentation behind the shoulders.

World Boerboel Breeders Association PTY. LTD.

info@worldboerboel.com

www.worldboerboel.com

UNITING BOERBOEL BREEDERS WORLDWIDE TO MOVE THE BREED FORWARD.

A round back
A hollow back
Drooping or hanging croup
Bandy legs
Cow hocks
Sickle hocks
Weak or inadequate pigmentation
Scars or injuries limiting movement
Obesity or under-weight relative to size

Disqualification:

- **Behaviour:**
 - Aggressive and uncontrollable
 - Exceptionally scared or timid
- **Build and conformation:**
 - Any sign of any other dog breed
 - Any visible fault that hampers proper mobility
 - Extremely short legs
 - Any serious deviation from the breed conformation
- **Head:**
 - Blue eyes
 - Serious entropion, ectropion or distichiasis
 - Excessive rose ears
 - “Peak” or upright ears
 - A narrow, too long or sharply pointed muzzle
 - Excessively long or short neck
 - A noticeable overbite
 - Whiskers such as those characteristic of other dog breeds
- **Body:**
 - Long hair
 - Curly hair
 - Kinked, corkscrew or deformed tails
 - Males without two well developed testicles
 - Any dog with a physical handicap, excluding deafness, which was not the result of an earlier injury.
